# Conveyors with underground passage

## Conveyor at 90°

- Supporting frame out of steel
- Machine completely mounted on ball bearings with conical bush block
- Large conveyor belts with PVC rods
- N. 4 identical double speed variators Ø 190mm section 2B for the complete adjustment of the machine
- The first collecting part forms a tape, which is carried, by means of an underground passage, to the second distributing part
- The second part distributes the tape on the inlet bench of the successive card

## Conveyor at 45°

- Supporting frame out of steel
- Machine completely mounted on ball bearings with conical bush block
- Vertical movement of the first belt for web transport for a better distribution
- Stainless steel layering rollers
- Belts width for material transport at the exit of the first collecting part: 700mm
- Belts width for material transport of the second distributing part with cross-lapper: 600mm
- Press-layer rollers for a proper distribution of the material on the inlet bench of the successive card
- N. 5 identical double speed variators Ø 190mm section 2B for the complete adjustment of the machine
- The first collecting part forms a layered tape, which is carried, by means of an underground passage, to the second distributing part
- The second part distributes the layered tape on the inlet bench of the successive card
